

### What is the UltraShape treatment?

Sometimes it takes more than a healthy lifestyle to reach the shape you desire. UltraShape has developed **the first safe and surgery-free** body contouring treatment to successfully remove fat cells and achieve effective and visible results.

The treatment, carried out by the UltraShape *Contour 1* device, is non-invasive and provides measurable body contouring results, without any side-effects and with no follow-up maintenance.

The UltraShape treatment is a conveniently short and simple procedure conducted in the physician's office. After treatment you can immediately resume your daily routine.

**Who is it for?** The UltraShape treatment has been designed to help average to overweight women and men acquire a shapely body contour. It offers an alternative to patients seeking effective removal of excess fat cells without surgery.

**What body parts are treated?** The UltraShape treatment focuses on the abdomen, inner and outer thighs ("saddle bags"), flanks ("love handles"), back, buttocks, the region beneath buttocks ("banana rolls"), and male breasts.

### What results can I expect?

Following treatment you can begin to enjoy your new body contour in as little as ten days. After a single treatment you will notice an average reduction of two centimeters in your body circumference. This is equivalent to a reduction of one apparel size.

The first effective non-invasive ultrasound solution for body contouring.

**Ask your doctor today if the UltraShape treatment is right for you.**

### What will I experience during treatment?

The treatment is performed in the physician's office. It will begin with the physician examining and marking the area to be treated. The size of the treatment area determines the duration of the session which can last between one to one and a half hours.

All you need to do is simply lie down on the comfortable *Contour 1* bed while a hand-held device delivering ultrasound beams gently glides over the marked region. The treatment does not require anesthesia. Treated patients have consistently reported a painless and comfortable experience. The entire procedure is guided by innovative tracking technology to ensure smooth and even contouring results. As soon as the session is over you can immediately resume your daily routine.

### What happens after treatment?

The UltraShape treatment is safe. Patients have stated that there was no post-treatment pain, discomfort or any other side-effects. The texture of the skin remains smooth and intact and there is no scarring.

### How does the UltraShape treatment work?

The UltraShape treatment uses scientifically proven non-invasive ultrasound technology to remove unwanted fat. An ultrasound beam selectively targets fat cells in the chosen body region and disrupts them without harming surrounding nerves, blood vessels or skin.

### What happens to the fat cells?

During the treatment the fat cell membranes are disrupted. Fat cell content, known as triglycerides, is dispersed into the fluid between the cells and then transported through the vascular and lymphatic systems to the liver. Once in the liver, there is no distinction between fat coming from the UltraShape treatment and fat originating from consumed food. They are both cleared from the liver via the body's natural mechanisms.
